

# Fisheries Communications Plan

Rev. 11

New England Wind

<b>Document Title:</b>	<b>Fisheries Communications Plan</b>
Company	New England Wind
Date:	June 2022
Document Type:	Plan
Revision:	11
Previous versions:	Rev. 1 – September 2016 Rev. 2 – October 2017 Rev. 3 – November 2017 Rev. 4 – December 2017 Rev. 5 – March 2018 Rev. 6 – June 2018 Rev. 7 – January 2019 Rev. 8 – August 2019 Rev. 9 – March 2020 Rev. 10– December 2021

# New England Wind Fisheries Communication Plan

---

Revised June 2022

## I. Introduction

New England Wind is the proposal to develop offshore renewable wind energy facilities in Bureau of Ocean Energy Management (BOEM) Lease Area OCS-A 0534 along with associated offshore and onshore cabling, onshore substations, and onshore operations and maintenance (O&M) facilities. New England Wind will be developed in two Phases with a maximum of 130 wind turbine generator (WTG) and electrical service platform (ESP) positions. Phase 1, which includes the Park City Wind project, will be located in the northeastern portion of Lease Area OCS-A 0534. Phase 2, which includes Commonwealth Wind, will occupy the remainder of Lease Area OCS-A 0534. Four or five offshore export cables (two for Phase 1 and two or three for Phase 2) will transmit electricity generated by the WTGs to onshore transmission systems in the Town of Barnstable, Massachusetts unless technical, logistical, grid interconnection, or other unforeseen issues arise.

Park City Wind LLC (the Company), a wholly owned subsidiary of Avangrid Renewables, LLC, will be responsible for the construction, operation, and decommissioning of New England Wind. The Company is committed to successful communication and coordination with the commercial and recreational fishing communities, and this Fisheries Communications Plan (FCP) will inform and direct the Company's fisheries engagement and communications.

The New England Wind FCP is a living document and aligns with the Vineyard Wind 1 FCP, which was first drafted in 2011 to improve communication with fishermen potentially affected by the development of that offshore wind project. This document continues to evolve with each iteration, benefitting from lessons learned and incorporating feedback and guidance from fishermen, fishing organizations, and regulatory agencies. The Company strongly believes that increased participation from the fishing industry in the development, construction, and operation of offshore wind projects will help the offshore wind sector to reduce user conflict, improve project design, and result in a better understanding between the two industries.

Visit <https://www.parkcitywind.com/fisheries> or <https://www.commonwealthwind.com/fisheries> to sign-up for updates, Offshore Wind Mariner Updates, and information requests as well as to access charts, frequently asked questions (FAQs), and completed fisheries science reports.

## II. New England Wind Lease Area

The Company holds Lease Area OCS-A 0534 (also known as the New England Wind Lease Area) for wind energy development on the Outer Continental Shelf (OCS). This Lease Area, which is shown in Figure 1, is located in the Massachusetts Wind Energy Area (MA WEA). The MA WEA was designated by BOEM, with significant stakeholder input, including the BOEM Massachusetts Renewable Energy Taskforce (made up of local and state elected officials in Massachusetts and Rhode Island), the Massachusetts Fisheries Working Group on Offshore Wind Energy (FWG),<sup>1</sup> and the Massachusetts Habitat Working Group on Offshore Wind

---

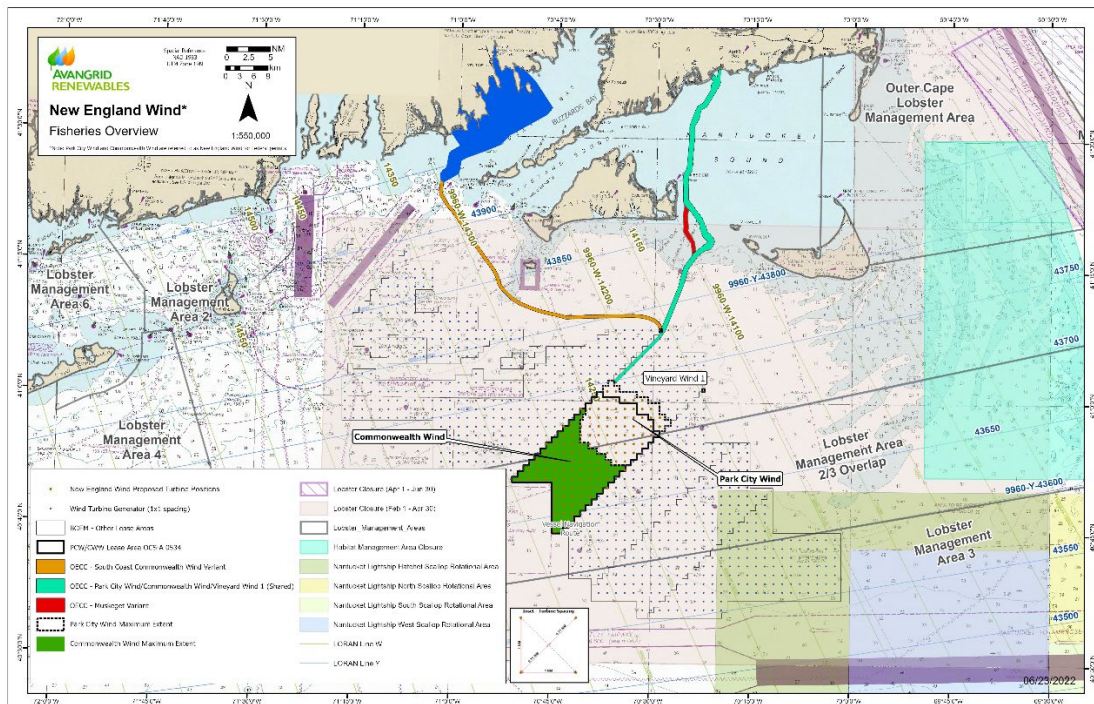

<sup>1</sup> The FWG is a voluntary, informal working group comprised of commercial fishermen and representatives from different ports and sectors, recreational fishermen, scientists, and state and federal agencies. The FWG, which was convened by the Commonwealth of Massachusetts, continues to meet and engage in offshore wind issues.

Energy (HWG),<sup>2</sup> to minimize and avoid impacts to the marine environment. For example, after considering stakeholder comments, BOEM modified the MA WEA to exclude an area of high fisheries value to reduce potential conflicts with commercial and recreational fishing activities. Siting choices such as these were considered to minimize and avoid potential impacts to fisheries and environmental resources from offshore wind development on the OCS.

Lease Area OCS-A 0534 is 159 square miles (sq. mi) in size and is located southwest of Lease Area OCS-A 0501, with the exception of two separate aliquots located along the northeastern boundary of Lease Area OCS-A 0501. At this time, the Company does not intend to develop the two positions in the separate aliquots. At its closest points (excluding the two separate aliquots), Lease Area OCS-A 0534 is just over 32 kilometers (km) (20 miles [mi]) from the southwest corner of Martha’s Vineyard and approximately 38 km (24 mi) from Nantucket. Water depths in the Lease Area (excluding the two separate aliquots) generally range from about 146 – 202 feet (24 – 34 fathoms), with depths gradually increasing as distance from land increases. Water depths in the separate aliquots range from 125 – 131 feet (20 – 22 fathoms).

As shown in Figure 1, some New England Wind WTGs and ESPs may be located in the southwest portion of Lease Area OCS-A 0501. This is because Lease Area OCS-A 0501 contains 10 “spare” or extra wind turbine positions for Vineyard Wind 1. If some or all of those spare positions are not developed for Vineyard Wind 1, they will be assigned to Lease Area OCS-A 0534 and developed as part of New England Wind.

**Figure 1. Lease Area and Offshore Export Cable Corridor for Park City Wind and Commonwealth Wind Projects**

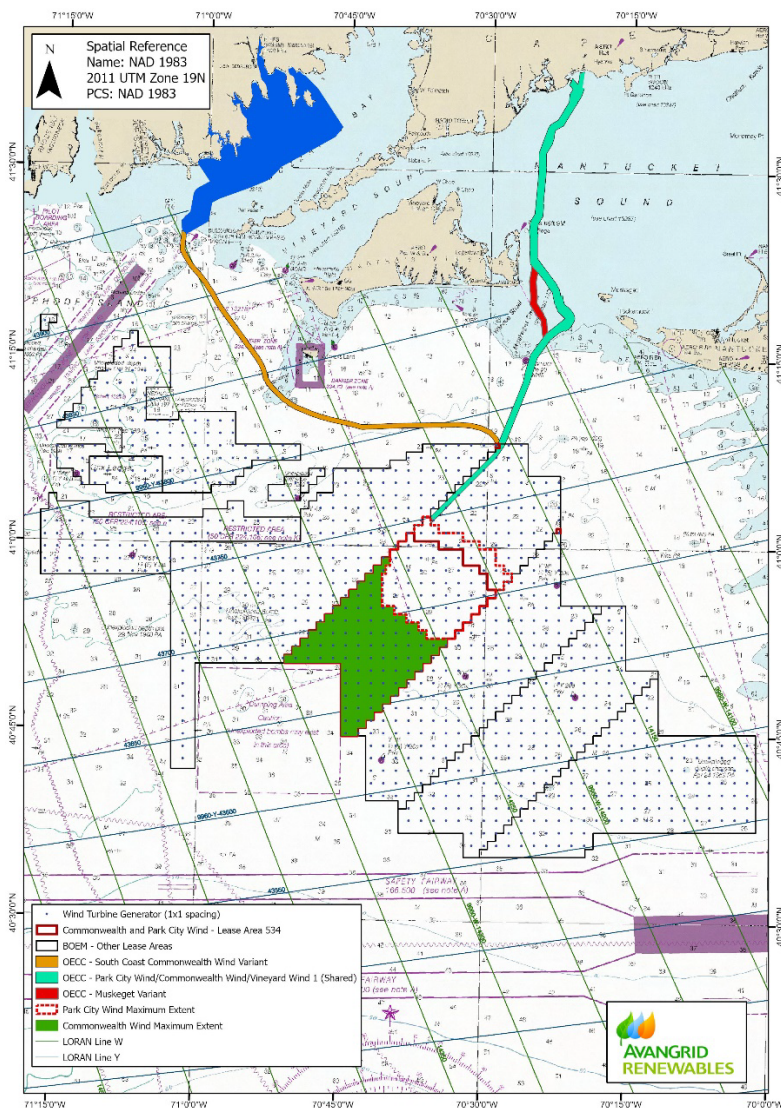

<sup>2</sup> The HWG is a voluntary, informal working group comprised of scientists and technical experts from environmental organizations, academia, and state and federal agencies. Early meetings addressed issues such as marine mammal and avian use of the potential offshore wind areas. The HWG, which was convened by the Commonwealth of Massachusetts, continues to meet and engage in offshore wind issues.

### III. The Company’s Offshore Wind Projects

The Company has been awarded long-term contracts for its Park City Wind and Commonwealth Wind offshore wind projects, both of which are located in the New England Wind Lease Area and are further described below. Park City Wind and Commonwealth Wind are collectively referred to as “the Projects.” The Projects’ export cables will be installed within a substantially similar Offshore Export Cable Corridor (OECC) and connect to the electric grid in West Barnstable, Massachusetts unless technical, logistical, grid interconnection, or other unforeseen issues arise. If needed for Phase 2, a variant cable corridor through Muskeget Channel and a variant cable corridor to the South Coast area of Massachusetts have been proposed (see Figure 2).<sup>3</sup>

Figure 2. OECC for Park City Wind (PCW) and Commonwealth Wind (CWW)

<sup>3</sup> While the Company intends to install all New England Wind offshore export cables within the OECC that travels from the lease area northward through the eastern side of Muskeget Channel towards landfall sites in the Town of Barnstable, the Company is reserving the fallback option to install one or two Phase 2 cables along the western side of Muskeget Channel, referred to as the Phase 2 OECC Western Muskeget Variant. (see Section 4.1.3.2 of COP Volume I).

#### a. Phase 1 (including Park City Wind)

Phase 1, which includes the Park City Wind 804-MW facility, will be located directly southwest of Vineyard Wind 1 in the northeastern portion of Lease Area OCS-A 0534 and potentially the southwestern portion of Lease Area OCS-A 0501 (if Vineyard Wind 1 does not develop some or all of its spare positions, as described above). The project site will be between 42 – 89 sq. mi in size with water depths ranging from 141 – 180 feet (approximately 24 – 30 fathoms). The Connecticut Department of Energy and Environmental Protection awarded Park City Wind long-term contracts with the Connecticut electric distribution companies in December 2019. The New England Wind Construction & Operations Plan (COP), which includes Park City Wind, was initially submitted in July 2020. Once operational, Park City Wind will deliver approximately 3.7 million megawatt hours of electricity per year, enough to power approximately 400,000 Connecticut households. Two offshore export cables will transmit electricity from the Phase 1 ESP(s) to one of two potential landfall sites in the Town of Barnstable, delivering power to the ISO-NE electric grid. The Phase 1 offshore export cables will be installed within the same OECC as Vineyard Wind 1’s offshore export cables.

#### b. Phase 2 (including Commonwealth Wind)

Phase 2 includes Commonwealth Wind and will deliver power to one or more Northeastern states and/or to other offtake users, including but not limited to 1,232 MW of power to the ISO-NE electric grid to meet the Company’s obligations under long-term contracts with Massachusetts electric distribution companies. When constructed, Commonwealth Wind will be located southwest of Park City Wind within Lease Area OCS-A 0534. The area developed for Commonwealth Wind will be between 86 – 117 sq. mi in size with water depths ranging from 154 – 203 feet (approximately 26 – 34 fathoms). Two or three offshore export cables will transmit electricity from the Phase 2 ESP(s) to one of two potential landfall site(s) in the Town of Barnstable, unless technical, logical, grid interconnection, or other unforeseen issues arise. While the Company intends to install all Phase 2 offshore export cables in the same OECC as Phase 1 and Vineyard Wind 1 cables, the Proponent has also identified two variations of the Phase 2 OECC (Figure 2).

## IV. Fisheries Team

To support fisheries communication and engagement, the Company employs Fisheries Liaisons (FLs), Fisheries Representatives (FRs), and Onboard Fisheries Liaisons (OFLs) to support offshore operations. A fisheries team organization matrix is provided as Figure 3, and contact details are provided in Section IV.a.

The FLs are employed by the Company and report directly to the Company’s Lead for Fisheries Outreach Coordination. The FLs are responsible for the overall implementation of this FCP and facilitating communication with the fishing industry. The FLs facilitate the work of the FRs by serving as a knowledgeable point of contact to which the FRs can efficiently and effectively communicate. The FLs also seek to:

- develop relationships and direct lines of communication with individuals that are representative of potentially impacted fishing regions, industries, and communities;
- understand and convey current fishing industry concerns and feedback to the fisheries team to identify and work towards solutions;
- maintain existing working relationships with FRs, and identify and engage new FRs;

- identify potentially affected fisheries and develop communication methods and tools to create two-way communication channels;
- work with scientists, agencies, and fisheries stakeholders to develop monitoring plans for fish species and habitats of concern; and
- ensure work opportunities for the fishing industry.

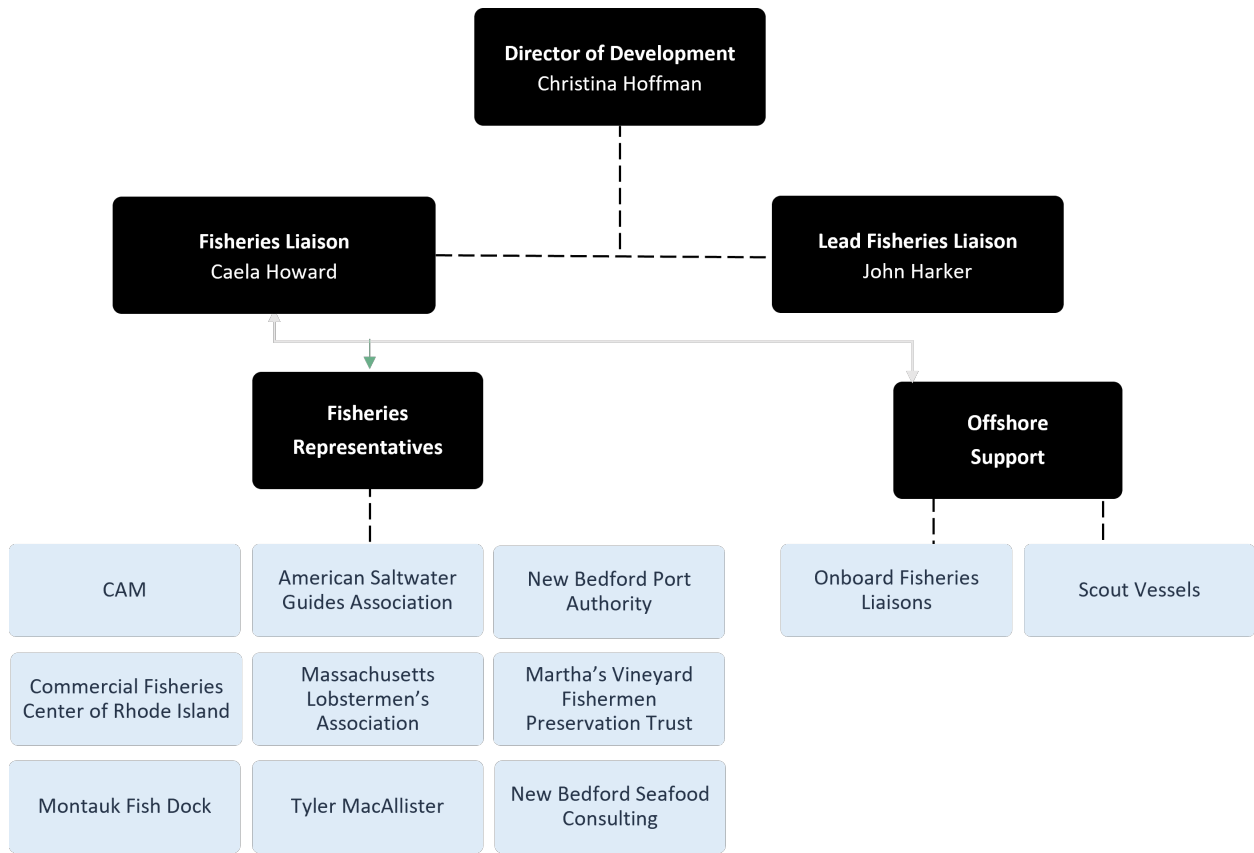

FRs do not work on behalf of the Company but represent a particular fishing community, organization, gear type, port, region, state, or sector(s). FRs are responsible for communicating fisheries concerns, issues, and other input to the Projects. Typically, the FR is an active recreational or commercial fisherman or group representing active fishermen within the region, fishery, state, or sector they represent. While FRs are compensated for their time and expenses by the Company, their duty is to the fishing region, industry, organization, gear-type, or sector they represent. FRs are solicited through a fair and equitable process by the Company to ensure these individuals or organizations adequately and appropriately represent their respective industry, gear type, port, or region and have the support of the fisheries stakeholders they represent.

The Projects' fisheries communications include engagement with FRs who represent a variety of gear types and homeports in Connecticut, Massachusetts, New York, and Rhode Island. Additional information about the FRs is provided in Appendix 1 and on our websites <https://www.parkcitywind.com/fisheries> and <https://www.commonwealthwind.com/fisheries>. The Company is committed to maintaining an effective network of FRs and is currently seeking additional FRs for the recreational community. If you are interested or have suggestions, please contact our FLs.

The FLs are further supported by offshore by fishing liaison consultants—referred to as Onboard Fisheries Liaisons (OFLs). OFLs are experienced fishermen employed to assist vessel captains with communication and document fishing gear encountered offshore to help avoid fishing vessel and gear interactions. OFLs serve an important function and are tasked with extending the role of the Projects' fisheries communications offshore so that there is effective communication onsite and in real-time. OFLs report to the FL and serve as their “eyes, ears, and voice” during offshore operations. The Projects contracted with fishermen who served as OFLs onboard survey vessels during the 2019, 2020, and 2021 survey seasons.

The Company also employs a Marine Operations Officer (MOO), also known as the Marine Operations Liaison Officer, who is responsible for safe marine operations and ensuring that the Company is a good neighbor while on the water. As such, there is frequent interaction, information exchange, and coordination between the MOO and the fisheries team.

Figure 3. Fisheries Team Organization Matrix

a. Contact Information

Contact information for the FLs and FRs is provided in Figure 4 below and posted on Park City Wind’s and Commonwealth Wind’s websites at <https://www.parkcitywind.com/fisheries> and <https://www.commonwealthwind.com/fisheries>, respectively. The FLs are available by phone, email, text, and through our website for ongoing communication. There is a specific form on our websites for fishermen to fill out their contact information and concerns. The form is sent directly to the FL’s email, and a follow-up phone call and/or email is made shortly after receipt of the contact information.

## V. Fisheries Engagement

The Projects' fisheries team has met with hundreds of fisheries stakeholders in recent years, including fishermen from various gear types and sectors, fishing advocacy organizations, and local fisheries groups who are most likely to be affected by offshore wind development on the OCS. The Company employs a variety of outreach and engagement approaches to communicate and maintain relationships with fisheries stakeholders. These approaches include informal conversations with existing contacts, expanding the Company's network of FRs, attending fishing industry trade events and recreational fishing shows and tournaments, presenting at commercial and recreational fishing group meetings, and working with the various associations and organizations that represent fishing interests.

Various outreach methods and tools are used to disseminate relevant project information to commercial and recreational fishing stakeholders. These outreach methods and tools include, but are not limited to, the following:

- organizing bi-weekly meetings with FRs to share project information and discuss concerns and current issues facing the fishing industry;
- working with FRs to distribute flyers, charts, FAQs, and receive feedback from the fishing community and discuss other relevant information through their networks and communication channels;

- creating outreach materials for fishing communities to distribute at different events as well as local bait and tackle shops in the region;
- holding “port hours” with FLs from other offshore wind developers at ports including but not limited to New Bedford, Massachusetts, Narragansett, Rhode Island, Stonington, Connecticut, and Montauk, New York to provide information to fishing vessel crews who fish in or transit through the MA WEA;
- maintaining a website with information specifically for fishermen, including fisheries science information, charts, mariner updates of offshore vessel activity, and vessel Requests for Information (RFIs);
- maintaining a database of fishing vessels interested in offshore wind, survey vessel, and guard vessel work as identified through our vessel RFI;
- reaching out to local recreational fishing organizations and clubs;
- presenting project information and updates on fisheries science at recreational organization meetings;
- hosting tables at commercial marine expos and recreational fishing shows;
- engaging with recreational fishing tournaments and derby organizers, including sponsoring events;
- engaging with local recreational fishing experts and influencers with a high social media presence to increase project awareness;
- relying on word of mouth (i.e., reaching out to a fisherman at the request of another fisherman); and
- maintaining a two-way communication channel with an expanding network of fishermen through our open-door policy.

The Projects’ fisheries team is also in regular contact with the relevant federal and state agencies on fisheries-related matters. We are a member of or active participant in the following technical working groups, advisory boards, councils, and commissions:

- Atlantic States Marine Fisheries Commission
- Connecticut Commission on Environmental Standards
- Massachusetts Fisheries Working Group on Offshore Wind Energy (FWG)
- Massachusetts Habitat Working Group on Offshore Wind Energy (HWG)
- Mid-Atlantic Fishery Management Council
- New England Fishery Management Council
- New York State Energy Research and Development's (NYSERDA’s) Environmental Technical Working Group
- NYSERDA’s Fisheries Technical Working Group (F-TWG)
- Project Advisory Committee for Automated Radio Telemetry at Offshore Wind Farms
- Regional Wildlife Science Entity (RWSE)
- Rhode Island Fisheries Advisory Board (FAB) meetings
- Responsible Offshore Science Alliance (ROSA)

The Company has used its membership and participation in these groups to provide project updates, better understand fisheries and fishermen concerns, build relationships, and collaborate on research and education.

Fisheries science is important to fisheries stakeholders, and our fisheries team is in regular contact with research institutions conducting fisheries research, such as UMass Dartmouth's School for Marine Science & Technology (SMAST) and the New England Aquarium, as well as fishermen supporting those research efforts. The FLs work with the FRs and scientists to identify fish species and habitats that have the potential to be impacted by offshore wind development. Research approaches have been developed to monitor species of concern and document potential changes in species abundance and distribution pre-/during/post-construction. The FLs are responsible for implementing and monitoring the effectiveness of this plan and updating it at least annually or as needed.

Finally, we understand that some fishermen do not feel adequately represented by fishing organizations, or FRs, and therefore prefer to share information and concerns individually and through different channels of communication. We recognize that individuals' concerns are just as important as group concerns and this FCP includes ongoing efforts to reach out to individual fishermen and respect requests for anonymity.

## VI. Offshore Communication Protocols

### a. Overview

Effective and efficient communication with fishermen is a high priority for the Company. It is important to ensure that fishermen are aware of our offshore activities and feel comfortable reaching out with questions and concerns. It is also important for vessel contractors to understand the fishing activities they may encounter and how to handle any interactions with the fishing fleet. The Company's communications protocols for offshore survey operations are outlined below and will be adjusted and adapted over time, as they continue to benefit from the Company's offshore experience and best practices. Similar protocols will be standardized and implemented for the Project's construction activities.

In the time leading up to offshore construction, the Projects will hold regular meetings with fishing groups that may be affected by offshore construction activities to review the construction timeline, what to expect during construction, and communication protocols. We will work with our FRs to help coordinate and invite fishermen to attend the meetings. Some of the small groups identified to date include squid vessels in Nantucket Sound, the conch fleet from Cape Cod and the Islands, state-permitted clam vessels, and the squid fleet from Point Judith.

Individuals and groups that want to stay updated on vessel activity and the Projects' offshore construction plans should visit our website and sign up for email and/or text alerts on the website.

### b. Communication and Notification to Fishing Industry Prior to and During Offshore Survey Work

Our communication strategy, which incorporates recommendations from fishermen and adopts protocols used by the Massachusetts Division of Marine Fisheries (MA DMF) for their biannual inshore trawl survey, are as follows:

- Coordinate with the US Coast Guard (USCG) to issue Notices to Mariners.
- Send Offshore Wind Mariner Update Bulletins (OWMUs) with a survey vessel picture, survey vessel contact information, a chart showing the location and approximate duration of vessel activity, OFL contact information, a scout vessel picture, and scout vessel contact information to our fisheries email list and text alert system. Post OWMUs on our four main media channels—LinkedIn, Facebook, Twitter, and Instagram.

- Work with FRs to share information through their email lists and other media channels.
- Publicize activities through state agencies, fishing organization websites, fish houses, harbor masters, and newsletters (e.g., MA DMF, Rhode Island Department of Environmental Management, Massachusetts Lobstermen’s Association [MLA], sector managers, National Oceanic and Atmospheric Association port agents, Fishing Support Services navigators, etc.).
- During offshore work, send out regular email/text updates detailing progress, both for work completed and upcoming work areas, to various parties (e.g., MA DMF, MLA, New Bedford Port Authority [NBPA], Martha’s Vineyard Fishermen’s Partnership Trust [MVFPT], etc.).
- Attend fisheries trade shows and outreach events to encourage fishermen to sign up for alerts that will inform them of the Projects’ offshore activities.

### c. Communication and Fisheries Protocols on Geological Survey Vessels

The Company contracts with local fishermen to serve as OFLs onboard survey vessels to assist vessel captains with communication and document fishing gear in the area to help avoid interactions. The OFL records observed fisheries activities, ensures vessel operations are compliant with this FCP and other fisheries-related policies, and seeks to avoid negative fisheries interactions by looking out for fixed gear and establishing communications (usually by very high frequency [VHF] radio) with fishing vessels when appropriate. If a negative fisheries interaction occurs, the OFL works with the FL and relevant FRs to quickly resolve the matter. Typically, OFLs with local fishing experience and knowledge are contracted for the duration of a vessel’s operations.

Before the survey trip begins, the FL and OFL attend pre-trip meetings with the captain and crew to review the specifics of the fisheries active in the area. If the FL has known coordinates of fixed gear in the area, the information is shared with the vessel captain and OFL. The vessel captain and crew are instructed to communicate respectfully with fishermen and work around fishing gear to the greatest extent practicable.

The captain, crew chief, the Company’s client representative, and OFL review and sign off on the communication and gear interaction protocols, which are outlined below, at the start of a survey campaign and whenever there is a new captain or party chief.

#### Communication Protocols for Survey Vessel Captains

- The OFL will have a VHF unit to monitor radio communications and will be able to communicate directly with fishermen if agreed upon with the vessel captain.
- If a fishing vessel is not responding to radio calls, the OFL will try to communicate with the fishing vessel. If the OFL is off watch, the crew will wake up the OFL if asleep to engage in communication if necessary.
- All communication between fishing vessels and the OFL, positive and negative, will be reported.
- The OFL will be alerted to all gear interactions at the time they occur, including waking up the OFL if necessary.
- The vessel captain will work around fishing gear to the greatest extent practicable.
- Fixed gear locations will be plotted while the OFL is off watch, and that information will be relayed to the OFL when back on watch.
- Agreed upon safety zones will be established and relayed to fishing vessels in the area.

- The OFL will have access to the wheelhouse to set up equipment if practicable.
- The OFL will be provided with a reliable internet connection.

#### Fixed Gear Interaction Protocols for Survey Vessels

The following outlines the Company's procedures in the event that an incident between a survey vessel and static fishing gear occurs. These procedures will be updated prior to the start of offshore construction activities for Park City Wind and Commonwealth Wind and will reflect any feedback and lessons learned during survey activities.

- For all incidents, the OFL will be immediately notified (wake up if off watch).
- For all incidents, the fishing gear interaction will be logged in both the daily vessel report spreadsheet and the Interaction Log. The time, location, photos, details of events, etc. will be recorded.
- If the fishing gear is entangled around survey equipment and is brought onboard, the OFL will determine if the fishing gear is actively engaged in fishing or if it is abandoned fishing gear (i.e., ghost gear).
- If the OFL determines that the fishing gear is actively engaged in fishing, and the line needs to be severed to release survey equipment, any severed gear will be kept on board.
- For active fishing gear where the line does not need to be severed, the gear will be returned to the water. Photos of the gear will be taken and the time and vessel position where the fishing gear is returned to the water will be recorded.
- If the OFL determines that the fishing gear is not actively engaged in fishing, the abandoned fishing gear will be kept on board the vessel and the position where it was retrieved will be recorded.
- All active severed fishing gear and ghost gear will be brought back to shore. If the owner can be identified, they will be notified, and the gear will be returned.
- For all incidents, vessel location and the time of any incident will be recorded.
- For all incidents, the buoy permit number and color will be logged as available.
- For all incidents, pictures of the gear will be taken.
- For all incidents, the FL on land will be notified of all gear interactions as soon as possible.

For the 2021 geological survey season, the Company hired local fishing vessels as scout vessels to plot where fixed gear is located and help survey vessels plan their survey operations so they avoid fixed gear. The scout vessels work in cooperation with OFLs to complete the communication cycle by working alongside and ahead of planned survey operations, reporting fishing activity back to the survey vessel, and helping to communicate with fishing vessels active in the area. This fishermen-based communication approach has resulted in successful coordination between the Projects' offshore survey efforts and local fishermen. We anticipate continuing this approach during the construction phase of the Project.

#### d. Safety Management System/Emergency Communication Protocols

An important objective of this FCP is to use fisheries communications to enhance the safety of all those who work on the ocean in a project area during development, construction, operations, and decommissioning. Our Safety Management System (SMS) will outline clear communication protocols and procedures for emergency events such as collision or allision of a vessel with a wind turbine structure, gear entanglement, damage to cables by fishing activity, catastrophic failure of a wind turbine, or another event.

Safety planning will be further elaborated in future updates of the FCP. The wind turbines, ESPs, and their foundations will be lit and marked in accordance with USCG, Federal Aviation Administration, and BOEM requirements, in order to promote navigational safety in and around Lease Area OCS-A 0534.

## VII. Fishing Gear Interaction Reporting

The Company has adopted a standard gear loss/damage claims form that was developed through coordination with FRs, FLs, and other developers. This form, which has also been adopted by Equinor, Mayflower, and Vineyard Wind 1, is provided on our websites (<https://www.parkcitywind.com/fisheries> and <https://www.commonwealthwind.com/fisheries>) along with the contact information for other developers' FLs.

## VIII. Fisheries Science Program

The Company recognizes the importance of and prioritizes collaborative science opportunities. Regionally focused collaborative research is the best approach to further understanding of the offshore environment and potential effects of offshore wind development. Collaboration and data sharing with environmental and fisheries stakeholders are also essential to build trust, identify priority research gaps, and address such gaps in a cost-effective manner. The Company is firmly committed to timely data sharing, transparent communication, and supporting independent and collaborative scientific research.

The Company currently maintains a robust fisheries science program to monitor fisheries and living marine resources within the Lease Area. As part of this program, the Company has worked with SMAST since 2017 to design and carry out fisheries monitoring plans that would capture potential fisheries impacts from offshore wind construction. Early on, we recognized the value of incorporating fishing community input into the planning stages of our research and data collection efforts. Towards that end, the Company tasked SMAST with hosting multiple interactive workshops with the fishing industry to identify priority areas for fisheries and ecological impact assessment.

Based on the input received from more than 75 commercial and recreational fishermen that attended these workshops as well as input from academics and government resource agencies, SMAST recommended a number of fisheries monitoring and research methods, which the Projects subsequently adopted to guide their fisheries monitoring plans. We have also worked with fishermen to ensure that we use fishing vessels to carry out our monitoring and research work.

The Projects also previously partnered with the New England Aquarium Anderson Cabot Center for Ocean Life to study highly migratory species presence across the MA WEA and Rhode Island/Massachusetts Wind Energy Area (RI/MA WEA), which was a direct request from recreational fishermen. The study involved a desktop compilation of conventional tagging data, large pelagic survey data, and input from the pelagic recreational fleet on fishing behavior in the WEAs through an online survey. The study determined that recreational effort for highly migratory species is widespread throughout southern New England, with the highest levels of recreational fishing activity occurring to the west of the MA WEA and RI/MA WEA. Results from that study are available at: <https://www.parkcitywind.com/fisheries> and <https://www.commonwealthwind.com/fisheries>.

### a. Data Sharing

The survey and monitoring work that the Company has conducted or plans to conduct will continue to generate a substantial body of environmental, fisheries, and other data that will be made available in the public domain in a manner consistent with other academic research. Much of the data is publicly available through the federal and state permitting processes, as well as reports or academic publications that result from survey or monitoring work and is readily accessible to environmental and fisheries stakeholders.

We proactively publish our fisheries monitoring data and related research on our website. Several seasons of fisheries data collected from the project area are available at: <https://www.parkcitywind.com/fisheries> and <https://www.commonwealthwind.com/fisheries>. For all other environmental and fisheries data, including data collected during the construction and post-construction period, the Company will explore appropriate ways to store and make data publicly available and easy to access. Through ROSA and/or the RWSE, the Company will also work with fishermen, regulators, stakeholders, and other offshore wind developers to find ways to streamline and standardize available data across all lease areas to further support independent research and collaborative science.

## X. Fishing Industry Initiatives

Aside from building relationships with the region's fishermen and fisheries stakeholders, one of the Company's key objectives is to support the fishing industry. This focus has resulted in the following recent efforts:

- **COVID-19 testing and vaccinations:** The Company participated in a consortium among the MA WEA and RI/MA WEA leaseholders to contribute funds to a Southcoast Health pilot program offering free COVID-19 testing directly at the Port of New Bedford.
- **Seafood Distribution Program donations:** The Company donated to the Commercial Fisheries Center of Rhode Island to support a program designed to provide benefits to households experiencing food insecurity and assist the fishing industry during the COVID-19 pandemic. The program purchases seafood directly from fishermen at or above market price and then donates the seafood to community organizations that provide it to families in need.
- **Vessel Request for Information:** The Company participated in an RFI in December 2020 to engage with vessel owners and fishing vessel crews who may be interested in offering services to the Projects. For additional information, please contact our FL (see Section IV).
- **WATERFRONT App:** The Company is working with Ithaca Clean Energy to help them develop a cellphone app that shows all of the Projects' offshore activities on an interactive map and provides a portal for fishing vessel crews and mariners to submit inquiries directly to the fisheries team. The goal is for the app to provide a single, consolidated location for fishing vessel crews and mariners to connect with and view information from all the MA WEA and RI/MA WEA leaseholders to help reduce email/text clutter and reduce uncertainty about which developer activities apply to that fishermen's operations.

## Appendix 1 – Fisheries Representatives

### **Coastal Asset Management LLC**

Coastal Asset Management LLC was founded by Connecticut-based fishermen to represent the interests and advocate on behalf of the Connecticut fishing community.

### **Commercial Fisheries Center of Rhode Island**

The Commercial Fisheries Center of Rhode Island (CFCRI) is the home of the Ocean State's commercial fishing community. It was founded to preserve commercial fishing as a profession, culture, and way of life through promoting the sustainability of the resource. CFCRI believes in cultivating an environment of open communication and encouraging the sharing of knowledge about our ocean and its resources. In the pursuit of sustainable seas, CFCRI's approach is innovative, their lens is optimistic, and their goals are ambitious.

CFCRI's members believe in commercial fishing as a profession, a culture, and a way of life. CFCRI seeks to preserve the sanctity of the local fishing community, the solvency of small business, and the sustainability of the fishery resource. CFCRI serves as a headquarters to bring fishermen, scientists, managers, and elected officials together in a collaborative effort to improve local fisheries and understanding of the marine environment so that the proud heritage of our industry continues nobly through future generations.

### **Massachusetts Lobstermen's Association**

The MLA is a member-driven organization that accepts and supports the interdependence of species conservation and the members' collective economic interests. It was established in 1963 by the fishermen, for the fishermen, and is presently one of the leading commercial fishing industry associations in New England. On behalf of the 1,800 members, the MLA works to maintain both the industry and the resource. It strives to be proactive on issues affecting the lobster industry and is active in the management process at both the state and federal levels. The MLA communicates with its members through a monthly newspaper, weekly email, Facebook, Twitter, and attendance at meetings. The MLA has become a trustworthy voice for the industry on important issues and is looked to by both the fishing industry and the management community.

### **The Martha's Vineyard Fishermen's Preservation Trust**

The MVFPT is a Massachusetts 501(c)(3) non-profit corporation established in 2011 to: (i) preserve the historic fishing fleets, communities, and economies of Martha's Vineyard; (ii) protect the marine populations and fishing grounds off the coast of Martha's Vineyard and New England; and (iii) educate the community about its local fisheries.

### **The Montauk Fish Dock – Paul Farnham**

The Montauk Fish Dock (Dock) is a commercial fish unloading packing and freight forwarding facility located in Montauk, New York. The Dock provides diesel fuel, ice, dockage, and fresh water. The Dock has been servicing the fishing fleet since 1988. Customer gear types are inshore and offshore draggers, inshore and offshore gillnetters, offshore bottom and surface longliners, inshore and offshore lobster, offshore sea scallop, and inshore and offshore rod and reel. The fleet consists of approximately 40 fishing vessels of which 20 vessels fish all year.

### **New Bedford Seafood Consulting – Jim Kendall**

Mr. Kendall is the Executive Director of New Bedford Seafood Consulting. He is a former scallop fisherman with over 50 years of experience in the fishing industry and with fisheries issues. Mr. Kendall was a member of a research team for the Commercial Fisheries Research Foundation that focused on discard mortality rates of Southern New England flatfish. Mr. Kendall served as a New England Fishery Management Council member for numerous terms. He has also served on the Massachusetts Fisheries Recovery Commission, the New England Commercial Fishing Law Enforcement Working Group, and is a founding member of the Massachusetts Fishermen's Partnership. Mr. Kendall was featured in the book *A Doryman's Reflection: A Fisherman's Life*. Additionally, he has been interviewed on WBSM radio and by the New Bedford Standard Times, the Gloucester Times, and the Boston Globe on fisheries issues.

### **New Bedford Port Authority**

The NBPA is the governing body for New Bedford's harbor and city-owned waterfront properties. It is chaired by the Mayor of New Bedford with six other members. The role of the NBPA is to support the Port of New Bedford by continually upgrading port resources, preserving its spot as the #1 U.S. fishing port, and expanding the New Bedford economy. The NBPA oversees all the commercial and recreational vessel activity within New Bedford city limits, incorporating the city's entire coastline and harbor.

### **The American Saltwater Guides Association – Tony Friedrich and Willy Goldsmith**

The American Saltwater Guides Association (ASGA) is the organizing voice for members of the recreational fishing community who find greater value in having access to abundant fish stocks rather than simply maximizing harvest. Members include for-hire captains and guides, fishing-related small businesses, and private anglers from Maine to Florida who fish for a broad range of state- and federally-managed species.

### **Tyler MacAllister – Representing the commercial and recreational hand gear fishery for Highly Migratory Species**

Tyler MacAllister currently participates in working groups for both commercially and recreationally targeted highly migratory species addressing current topics. These species include tunas, marlin, swordfish, and several species of sharks.
